Chapter 1

ComCasp - Communication with Caspian board

1.1 Introduction

Varioptic provides a set of functions in a DLL to communicate with Caspian Board.

This DLL allows customers to use its own programming language (C ...) or tool (Labview ...)

1.2 Installation

DLL require Microsoft Windows XP/Vista/Seven/8 32/64 bit operating system.

Caspian board must be properly installed on system, and must be seen as a virtual Serial port.

1.3 Version

Current Version is 1.0.

See [DLL Revision - History](#) for version history.

1.4 DLL Overview

DLL provides some sub-set of functions :

- [Communication management functions](#)
- [Board's Settings](#)
- [Code Range](#)
- [Direct Register Access](#)

1.5 Connection

DLL is fairly simple to use.

Once board plugged, the first call must be [Casp_OpenCOM\(\)](#).

This function will search for connected board on workstation. Once board is found, function return [eCaspSuccess](#).

Most functions return an [eCOMCaspErr](#) code to indicate if completion was successfull or not.

[eCOMCaspErr](#) code can be converted to a string using [Casp_GetErrorMsg\(\)](#) function.

Once communication is no more needed, [Casp_CloseCOM\(\)](#) must be call for cleanup.

1.6 Change Settings

Once connection is establish, Board settings may be changed.

To change Focus Voltage, see [Casp_SetFocus\(\)](#).

1.7 Registers access

Using Registers map, this set of function allow low level access on board. Use with caution.

See [Direct Register Access](#).

Chapter 2

DLL Revision - History

2.1 Version 1.0

- Initial public release.

Chapter 3

Module Documentation

3.1 Communication management functions

Defines

- #define `MAX_PORT_NUMBER` 20

Enumerations

- enum `eCOMCaspErr` {
 `eCaspSuccess` = 0, `eCaspTimeOut`, `eCaspCmdFailed`, `eCaspNACKResponse`,
 `eCaspNotFound`, `eCaspNotConnected`, `eCaspOutOfRange`, `eCaspCRCErr`,
 `eCaspWriteErr`, `eCaspResponseIncomplete`, `eCaspErrTotal` }

Functions

- COMCASP_API `eCOMCaspErr Casp_OpenCOM` ()
- COMCASP_API `eCOMCaspErr Casp_OpenCOMIdx` (int paldxPort)
- COMCASP_API `eCOMCaspErr Casp_CloseCOM` ()
- COMCASP_API int `Casp_SysCOMCount` ()
- COMCASP_API const char * `Casp_SysCOMName` (int paldxPort)
- COMCASP_API void `Casp_SysCOMNames` (const char *paCOMArray[`MAX_PORT_NUMBER`], int *paSize)
- COMCASP_API const char * `Casp_GetErrorMsg` (`eCOMCaspErr` eErr)

3.1.1 Detailed Description

Establish and manage communication with board.

`eCOMCaspErr` is return by most functions as a return of execution.

See also

`Casp_GetErrorMsg`() to convert code to string

First call must be `Casp_OpenCOM()` or `Casp_OpenCOMIdx()`, last one `Casp_CloseCOM()`.

Retrieve user friendly message from `eCOMCaspErr` with `Casp_GetErrorMsg()`

. In case of manual COM port selection, use `Casp_SysCOMCount()` for available COM port on current system.

`Casp_SysCOMName()` provides individual convenient name for each available port, `Casp_SysCOMNames()` provides name for every ports.

3.1.2 Define Documentation

3.1.2.1 #define MAX_PORT_NUMBER 20

Max COM port supported

3.1.3 Enumeration Type Documentation

3.1.3.1 enum eCOMCaspErr

Enumerator:

eCaspSuccess Function call success.
eCaspTimeout Timeout occur before completion.
eCaspCmdFailed Command failed.
eCaspNACKResponse Wrong response from command.
eCaspNotFound Board not found at call [Casp_OpenCOM\(\)](#).
eCaspNotConnected Not connected to Board (call [Casp_OpenCOM\(\)](#) first).
eCaspOutOfRange Parameter out of range.
eCaspCRCError CRC Error.
eCaspWriteErr Error while writing to serial port.
eCaspResponseIncomplete Response incomplete.
eCaspErrTotal

3.1.4 Function Documentation

3.1.4.1 COMCASP_API eCOMCaspErr Casp_OpenCOM ()

Open Communication with board.

3.1.4.2 COMCASP_API eCOMCaspErr Casp_OpenCOMIdx (int paldxPort)

Open Communication with board on a given COM port index.

3.1.4.3 COMCASP_API eCOMCaspErr Casp_CloseCOM ()

Close Communication with board.

3.1.4.4 COMCASP_API int Casp_SysCOMCount ()

Query system COM port count.

3.1.4.5 COMCASP_API const char* Casp_SysCOMName (int paldxPort)

Query system COM port name by index.

Parameters

<i>paldxPort</i>	COM port index.
------------------	-----------------

See also

[Casp_SysCOMCount\(\)](#).

Returns

Pointer to COM name, of NULL if error.

3.1.4.6 COMCASP_API void Casp_SysCOMNames (const char * *paCOMArray*[MAX_PORT_NUMBER], int * *paSize*)

Query system COM port names.

Parameters

<i>paCOMArray</i>	array of strings. Use define MAX_PORT_NUMBER for initial size.
<i>paSize</i>	Effective string in array.

See also

[Casp_SysCOMCount\(\)](#) for array size.

Note

Array's string are internal. No need to free them.

3.1.4.7 COMCASP_API const char* Casp_GetErrorMsg (eCOMCaspErr *eErr*)

Retrieve String from execution code.

Parameters

<i>eErr</i>	Execution code return by a previous functions.
-------------	--

See also

[eCOMCaspErr](#)

3.2 Board's Settings

Functions

- COMCASP_API [eCOMCaspErr Casp_SetFocus](#) (double *paFocus*)

3.2.1 Detailed Description

Change settings on board.

Set Focus voltage with [Casp_SetFocus\(\)](#).

Function return [eCOMCaspErr](#) on completion.

3.2.2 Function Documentation

3.2.2.1 COMCASP_API [eCOMCaspErr Casp_SetFocus](#) (double *paFocus*)

Set Focus voltage

Parameters

<i>paFocus</i>	Set focus voltage (range from 24 Vrms to 70 Vrms)
----------------	---

3.3 Board's Status

Functions

- COMCASP_API [eCOMCaspErr Casp_GetFocus](#) (double *paVoltage)

3.3.1 Detailed Description

Retrieve status from board.

Read Focus voltage with [Casp_GetFocus\(\)](#).

Function return [eCOMCaspErr](#) on completion.

3.3.2 Function Documentation

3.3.2.1 COMCASP_API [eCOMCaspErr Casp_GetFocus](#) (double * *paVoltage*)

Read focus voltage

Returns

paVotlage Focus Voltage (range from 24 Vrms to 70 Vrms)

3.4 Code Range

Defines

- `#define FOCUS_VOLTAGE_MIN 20.0`
- `#define FOCUS_VOLTAGE_MAX 70.0`

3.4.1 Detailed Description

Set of usefull defines.

define Limits for Focus Voltage, Tilt Range, Driver Range and Delta.

3.4.2 Define Documentation

3.4.2.1 `#define FOCUS_VOLTAGE_MIN 20.0`

Focus Voltage Low value

3.4.2.2 `#define FOCUS_VOLTAGE_MAX 70.0`

Focus Voltage High value

3.5 Direct Register Access

Defines

- #define [REG_FOCUS_LSB](#) 0x00
- #define [REG_FOCUS_MSB](#) 0x01

Functions

- COMCASP_API [eCOMCaspErr Casp_ReadAddress](#) (unsigned char paAddr, unsigned char *paValue)
- COMCASP_API [eCOMCaspErr Casp_ReadAddressArray](#) (unsigned char paAddr, unsigned char *paArray, unsigned char paArraySize)
- COMCASP_API [eCOMCaspErr Casp_WriteAddress](#) (unsigned char paAddr, unsigned char paValue)
- COMCASP_API [eCOMCaspErr Casp_WriteAddressArray](#) (unsigned char paAddr, unsigned char *paArray, unsigned char paArraySize)

3.5.1 Detailed Description

Low level function to access board registers.

Define Name for register addresses.

Set of function for registers access. See documentation for registers map. Registers are unsigned 8bit. Read single register value with [Casp_ReadAddress\(\)](#).

Write single register value with [Casp_WriteAddress\(\)](#).

To write several registers in a row, use [Casp_WriteAddressArray\(\)](#).

All functions return [eCOMCaspErr](#) on completion.

3.5.2 Define Documentation

3.5.2.1 #define [REG_FOCUS_LSB](#) 0x00

Focus LSB address

3.5.2.2 #define [REG_FOCUS_MSB](#) 0x01

Focus MSB address

3.5.3 Function Documentation

3.5.3.1 COMCASP_API [eCOMCaspErr Casp_ReadAddress](#) (unsigned char *paAddr*, unsigned char * *paValue*)

Read register value by address.

Parameters

<i>paAddr</i>	Register adress.
<i>paValue</i>	Register's value read.

3.5.3.2 COMCASP_API eCOMCaspErr Casp_ReadAddressArray (unsigned char *paAddr*, unsigned char * *paArray*, unsigned char *paArraySize*)

Read array of registers by address.

Parameters

<i>paAddr</i>	Register adress.
<i>paArray</i>	Storage array for values to read.
<i>paArraySize</i>	Number of value to read.

3.5.3.3 COMCASP_API eCOMCaspErr Casp_WriteAddress (unsigned char *paAddr*, unsigned char *paValue*)

Write register single value by address.

Parameters

<i>paAddr</i>	Register adress.
<i>paValue</i>	Register's value to write.

3.5.3.4 COMCASP_API eCOMCaspErr Casp_WriteAddressArray (unsigned char *paAddr*, unsigned char * *paArray*, unsigned char *paArraySize*)

Write array of values at a starting address.

Parameters

<i>paAddr</i>	First register address.
<i>paArray</i>	Array of values to write.
<i>paArraySize</i>	Number of value to write.
